

## **BRS Save #107**

A Norwegian paraglider pilot was enjoying a pleasant day of ridge soaring. After climbing high, a wave-induced rotor collapsed his wing. After re-inflating, the wing collapsed two more times. Jon Lorentzen deployed his BRS.

“We are trained to re-inflate the wing; this is standard procedure. But I'm less experienced and when I could not keep the wing inflated, I was losing height rapidly. I deployed. It worked well! Both canopies ended up open and I landed so softly I was able to relaunch and flew again that same day. Thanks, BRS!”

Result: Pilot Survived!
